

CLAIM - Alpha as a Frozen Closure Ledger

The expression is not fitted; it is read from named closure structure.

Full closure

Beat closure

The expression below is written as a closure ledger. The integers are not introduced as adjustable constants; they are named positions in the RT release geometry before the numerical value is judged. The local beat cell comes first; full closure is six such cells. Rho is read internally as $210/21 = 210/(42/2) = 10$; then $Z3 = 30/\rho = 3$. The reduced gap is read as sectorwise seam exclusion. Interactive support: RT_ALPHA_READOUT_GEOMETRY.html lets the reader step through the closure hierarchy visually; it is a readout aid, not a substitute for the claim.

Alpha ledger decomposition

Normalization, main closure count, and correction bracket shown as separate ledger blocks.

structure

$$\alpha_{RT} = \frac{\pi}{30 \cdot 1260} [3 \cdot 30 - \Delta_\alpha]$$

correction bracket

$$\Delta_\alpha = 2 + \frac{2}{10} - \frac{1}{10(42-3)} - \frac{20}{21 \cdot 10 \cdot (42-3) \cdot 30 \cdot 7}$$

expanded expression

$$\alpha_{RT} = \frac{\pi \left(3 \cdot 30 - \left(2 + \frac{2}{10} - \frac{1}{10(42-3)} - \frac{20}{21 \cdot 10 \cdot (42-3) \cdot 30 \cdot 7} \right) \right)}{30 \cdot 1260}$$

Claim test

To refute it, identify the free term, the invalid ledger link, or a stricter ledger that gives another value. The target is local: a specific term, a specific link, or a stronger alternative ledger.

CLAIM TEST - Break the Ledger

Every objection must point to a specific term, link, or stronger alternative ledger.

Formula structure

structure

$$\alpha_{RT} = \frac{\pi}{30 \cdot 1260} [3 \cdot 30 - \Delta_{\alpha}]$$

correction bracket

$$\Delta_{\alpha} = 2 + \frac{2}{10} - \frac{1}{10(42-3)} - \frac{20}{21 \cdot 10 \cdot (42-3) \cdot 30 \cdot 7}$$

expanded expression

$$\alpha_{RT} = \frac{\pi \left(3 \cdot 30 - \left(2 + \frac{2}{10} - \frac{1}{10(42-3)} - \frac{20}{21 \cdot 10 \cdot (42-3) \cdot 30 \cdot 7} \right) \right)}{30 \cdot 1260}$$

Normalization

30 x 1260

C30 readout grid times full closure.

Main count

3 x 30

Three-sector count over C30.

Correction bracket

Delta_alpha

A/B, rho, sector gap, active 20/21 duty.

Term ledger

Only ledger-compatible closures survive the fixed release geometry.

rho is read internally as 210/21 = 210/(42/2) = 10; hence Z3 = C30/rho = 30/10 = 3.

The mechanical rotor/microcell origin of rho=10 remains outside this narrow alpha claim.

Sectorwise seam exclusion: 7=(3x2)+1; 21=3x7; 42=3x14; one seam per Z3 sector gives 42-3=39.

Readout-mode rule: 21 is read as one collapsed active-duty window; 42 is read sectorwise as 3x14.

Symbol / term	Ledger meaning	Role
pi	rotor / circular phase normalization	turns closure defect into angular measure
30	C30 readout grid	base unit in numerator and denominator
42	closure wave count	combines with 30 into full closure
1260	full closure	6 x 210 = 30 x 42; global normalization
210	local beat closure	lcm(30,42) = 210; precedes full closure
7	local 7-cell: (3x2)+1 = 6+1	C30 beat leg; six Z3x A/B slots plus one seam
5	210 / 42	42-wave side of beat cell
21	42 / 2 = 3 x 7; collapsed A/B aperture	alpha window; one seam excluded gives 20
20/21	active fraction inside 21-window	final duty correction
2	A/B two-sided readout	leading correction term
3	Z3 sector count: 30 / rho = 30 / 10 = 3	appears in 3 x 30 and 42 - 3
42 - 3 = 39	sectorwise seam exclusion: 42=3x14 -> 3x(14-1)	gap denominator; one seam excluded per Z3 sector
10	rho = 210 / 21 = 210 / (42/2)	internal ledger ratio; mechanical rotor origin out of scope

Correction bracket, term by term

2	A/B base
2/10	A/B read through rho = 10
1/[10(42-3)]	sectorwise seam-excluded gap: 42=3x14 -> 3(14-1)
20/[21*10*(42-3)*30*7]	gate intersection: active 20/21, rho=10, gap 39, C30, local 7-cell

Final claim

alpha_RT is proposed as a closure-geometric entity, structurally analogous to pi:

pi measures circular closure; alpha_RT measures closure defect in the RT release ledger.
